Register = storage operators v. small (8, 16, 32 bits) slow but v. fast in terms of access speed used for temp. store of operands of which the CPU works

Operands = commands, data or adresses

register = 1000x faster than RAM or HDD

left = EU — executive unit

right = BIU — bus interface unit

base 2 — is a representation mechanism

base 16 — // — (more compact)

base 10 — interpretation mechanism

data type = structure + associative operations

- data encapsulation
- inheritance
- polymorphism

⇒ OOP

ASM data type = sizeof representation

80x86 CPU
